

## Maintain

BlueStream Professional Services offers maintenance and optimization services designated to keep networks running at their peak. We help operators improve their service quality, reduce operational costs and eliminate unnecessary expenses.

Our maintenance services consist of a comprehensive network assessment, preventative maintenance, and the shifting network assets through decommissioning and removal services. Along each step, we offer comprehensive Program and Project Management to simplify the entire process, and to give our customers a single point of accountability.

**Program and Project Management:** In addition to Program and Project Management for planning and implementation, BlueStream provides these services for maintenance.

**Network and Inventory Audit:** As part of the maintenance process, BlueStream can assess network architectures, legacy records, processes and databases that have an immediate and direct effect on operational areas that include:

- Asset verification and recovery
- Provisioning
- Facilities optimization

**Preventative and Routine Maintenance:** It goes without saying that preventative and scheduled maintenance are essential to maintain operational integrity. As well, maintenance services can also reduce the overall costs of network ownership. A well-maintained network, serviced by the technicians with the widest array of equipment and facilities expertise, decreases service disruption caused by faulty elements and reduces expenditures for emergency service. BlueStream offers services for power, equipment and facilities maintenance. We also perform all necessary preventative maintenance recommended by equipment manufacturers including scheduling software updates for active elements. We work closely with our customers to develop additional requirements for reactive/emergency maintenance services and we offer maintenance programs tailored to each customer's unique needs.

**Decommissioning and Removals:** Preventative maintenance is only part of the picture when it comes to maintaining the overall health of a network. It's often necessary to consolidate underutilized network elements or to replace existing assets with newer equipment to support service demands and the migration to new technologies. These changes in the network create a number of operational issues, including:

- Prevention of service disruptions
- Proper disposal or recycling of hazardous materials
- Reconfiguring battery distribution fuse bays
- Fire hazard reduction
- Safety equipment and training
- Network/environment compliance

*BlueStream offers complete turnkey services for the decommissioning and removal of all types of equipment, from a single site to multi-city projects.*
